Reasoning Fire Structural Coordinate Model (Integrated Version)

This document integrates the 3-axis structural coordinate model with the proposed W-axis extension.

Core Axes:

X-Axis: Representation Density
Measures compression and abstraction of world representation.
From rules → features → embeddings → high-dimensional distributions → implicit structures.

Y-Axis: Decision Closure
Measures how quickly uncertainty is collapsed.
From deferred → conditional → immediate → maximized → irreversible decisions.

Z-Axis: Structural Persistence
Measures whether structure survives beyond one output.
From transient → contextual → replayable → auditable → accountable structures.

W-Axis (Extension): Structural Dissipation Rate
Measures how quickly structure collapses after output.
Low W: Structure remains coherent and accountable.
High W: Structure dissolves immediately after response.

Model Positioning:

LLM:
High X, Mid Y, Low Z, High W
Speaks fluently but leaves no structural trace.

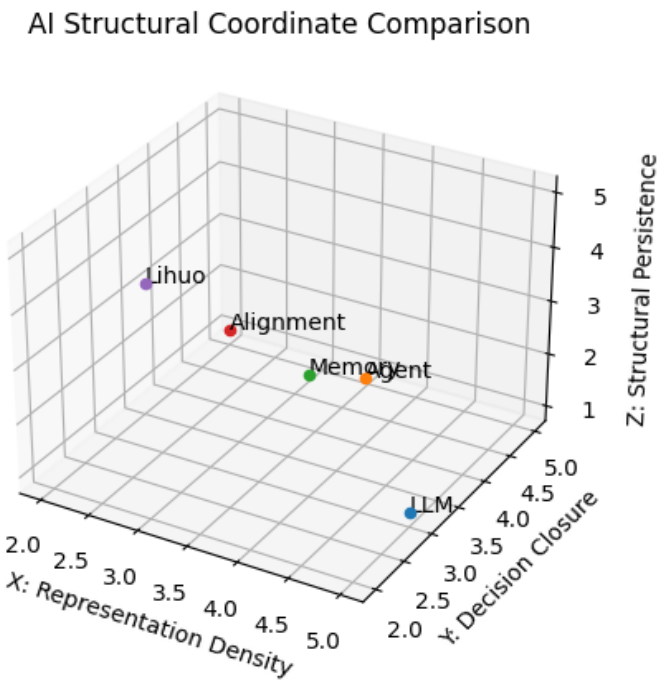

Agent Systems:
High X, High Y, Low-Mid Z, Mid-High W
Acts decisively but weak persistence.

Memory / RAG:
High X, Mid Y, Mid Z, Mid W
Can replay but not fully accountable.

Alignment / RLHF:
X-agnostic, Very High Y, Very Low Z, Very High W
Stabilizes behavior by collapsing structure early.

Reasoning Fire Layer:
X-independent, Intentionally Lower Y, Very High Z, Low W
Governance of structural survival rather than output governance.
