SAC 2.0 & SEED Structural Branching Framework (v1.0)

1. Foundational Principle

- Reproducibility is the supreme structural constraint.
- Responsibility depends on structural reproducibility.
- Boundary integrity depends on verifiable state recovery.
- Any alignment modification must not corrupt reproducibility.

2. SAC 2.0 — Dual Coordinate Aesthetic Audit Layer

- Internal Coordinate: Concept–Causality consistency.
- External Coordinate: Commitment–Responsibility traceability.
- Function: Audit structural legitimacy, not narrative continuity.
- Priority: Structure over tone, boundary over persuasion.

3. SEED — Structural Re-entry & Exchange Protocol Layer

- SEED is an engineering projection of SAC constraints.
- Records stopping conditions, not narrative content.
- Enables cross-thread and cross-project structural recovery.
- Must remain non-narrative and field-locked.
- Cannot be softened by alignment tone adjustments.

4. Governance Structure

- SAC defines structural legitimacy.
- SEED implements structural transport.
- SAC may audit SEED.
- SEED must not be narrativized by SAC.

5. Evolution Rule

- Reproducibility cannot be sacrificed for alignment.
- Updates must be verifiable, not interpretive.
- Structure first. Responsibility second. Boundary third.

End of Document — Structural Integrity Maintained.
